

Is your water smelling musty?

As the dog days of summer continue to heat us all up it also heats up our water. The water in the lake, in the ground, and in BWD's storage tanks is at its warmest temperatures of the year. This makes it difficult to maintain the high standards of water quality that we expect without having to dramatically increase the chlorine levels in the water. BWD continually tests the water to make sure it is safe to drink and the problem should only last until the temperatures begin to cool in the fall.

The best thing to try for now is to run the water until it cools out of the faucet before drinking and keeping some in the refrigerator.
